# Jumping Right In

Improve search for  $H \rightarrow b\bar{b}$  associated with a  $Z$  for  $m_H \approx 120$  GeV.

Higgs Signal

$b\bar{b}$  form color singlet

# Jumping Right In

Improve search for  $H \rightarrow b\bar{b}$  associated with a  $Z$  for  $m_H \approx 120$  GeV.

Higgs Signal

$bs$  form color singlet

$Z + b\bar{b}$  Background

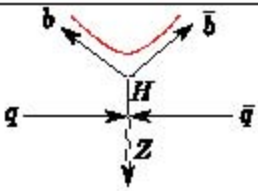

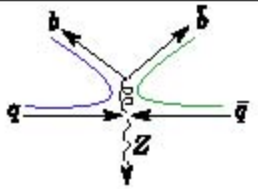

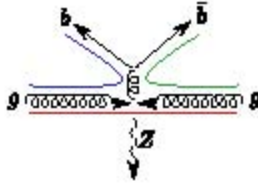

$bs$  are color connected to beam

Kinematic variables to distinguish signal from background somewhat...

Good ones are  $P_T^H$ ,  $P_T^Z$ ,  $\Delta\eta_{b\bar{b}}$ ,  $\Delta\phi_{b\bar{b}}$

For *given* kinematics, *color* structure is different

Higgs	
$q\bar{q}$ Background	
$gg$ Background

# Background Event Example 1

## Background Example 2

# Showering Same Event Millions of Times

# Showering Same Event Millions of Times

# Showering Same Event Millions of Times

Higgs:

$$\Delta\eta_{b\bar{b}} = 1$$

$$\Delta\phi_{b\bar{b}} = 2$$

Add up  $E_T$  in  
each cell:

# Signal vs Background Accumulated $E_T$

Higgs:

$q\bar{q}$

$q\bar{q}X$

$gg$

$ggX$

# Probability that a GeV of $E_T$ somewhere is from Higgs

Higgs:

$q\bar{q}$

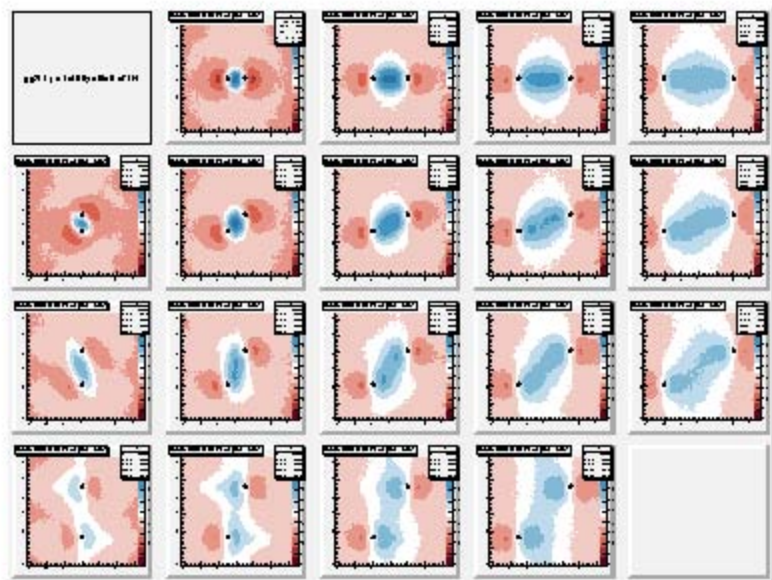

Important discrimination isn't at jet center — it's  $\Delta R \approx 0.5 - 1.5$  away.

# Probabilities for Pt Deposits

# Different Jet Separations

Given that you saw a few GeV here and there, what's the probability that the event you're looking at is Higgs?

Given that you saw a few GeV here and there, what's the probability that the event you're looking at is Higgs?

We have:  $P(\text{GeV} @ (\eta, \phi) \mid \text{Higgs})$   
and  $P(\text{GeV} @ (\eta, \phi) \mid \text{Background})$

Given that you saw a few GeV here and there, what's the probability that the event you're looking at is Higgs?

We have:  $P(\text{GeV} @ (\eta, \phi) \mid \text{Higgs})$   
and  $P(\text{GeV} @ (\eta, \phi) \mid \text{Background})$

You See: 50 GeV @  $(\eta_1, \phi_1)$ ,  
20 GeV @  $(\eta_2, \phi_2)$ ,  
...

Given that you saw a few GeV here and there, what's the probability that the event you're looking at is Higgs?

We have:  $P(\text{GeV} @ (\eta, \phi) \mid \text{Higgs})$   
and  $P(\text{GeV} @ (\eta, \phi) \mid \text{Background})$

You See: 50 GeV @  $(\eta_1, \phi_1)$ ,  
20 GeV @  $(\eta_2, \phi_2)$ ,  
...

We Want:  $P(\text{Higgs} \mid E_1 @ (\eta_1, \phi_1) \& E_2 @ (\eta_2, \phi_2) \& \dots)$

Given that you saw a few GeV here and there, what's the probability that the event you're looking at is Higgs?

assuming each GeV is independent,  
$$= \prod_i P_{\text{Higgs}}(\eta_i, \phi_i)^{E_i / E_{\text{event}}}$$

(this plot includes only events with well-separated jets)

(this plot includes only events with well-separated jets)

Switching to more general technique looking more locally at each jet...

## CDF II Preliminary

- DATA
- PYTHIA Tune A
- HERWIG
- PYTHIA
- ... PYTHIA (no MPI)

... but our jet “shapes” seem to have angular information ...

## Jet Moment or “pull”

Add up particles or calorimeter energy deposits *within* a jet:

## Jet Moment or “pull”

Add up particles or calorimeter energy deposits *within* a jet:

$$\vec{n}_j = \sum_i \frac{E_T^i |\vec{r}_i| \vec{r}_i}{E_T^{jet}} \quad \text{where} \quad \vec{r}_i = (\eta_i - \eta_{jet}, \phi_i - \phi_{jet})$$

## Jet Moment or “pull”

Add up particles or calorimeter energy deposits *within* a jet:

$$\vec{m} = \sum_i \frac{E_T^i |\vec{r}_i| \vec{r}_i}{E_T^{jet}} \quad \text{where} \quad \vec{r}_i = (\eta_i - \eta_{jet}, \phi_i - \phi_{jet})$$

- Angle of moment gives “pointing” direction of teardrop
- Length of moment gives measure of confidence
  - not used today... didn't find it helped much

# Jet Moments for one $b$ for $\Delta\eta_{jj} = 0$ and $\Delta\phi_{jj} = 1$

Higgs Signal  
(Toward Other Jet)

Uncrossed Background  
(Toward Left Beam)

Crossed Background  
(Toward Right Beam)

# Jet Moments for one $b$ for $\Delta\eta_{jj} = 0$ and $\Delta\phi_{jj} = 1$

Higgs Signal  
(Toward Other Jet)

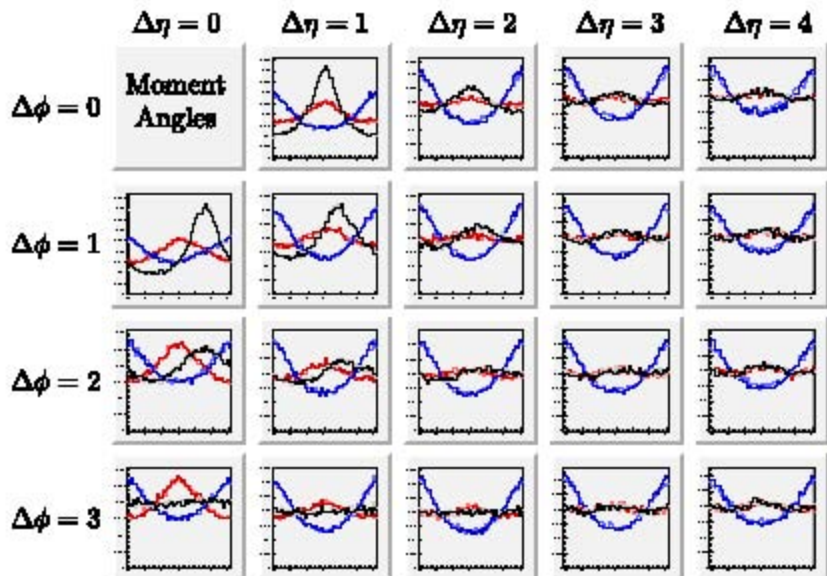

Uncrossed Background  
(Toward Left Beam)

Crossed Background  
(Toward Right Beam)

# Moment Angles for Higgs and Background

Back-to-back Higgs  $b\bar{s}$  (and glue) are elliptical, not teardrop shaped.

# Moment Angles for Higgs and Background

Moment Angles for *full* **Higgs signal** /  $Z + b\bar{b}$  **background** :

Angle toward other b-jet:

Angle toward closest beam:

Angle toward other b-jet is nicely independent of kinematics:

No correlation with  $P_T$  of Higgs

No correlation with jet orientation

etc

# How Much Does This Help?

Found relatively more radiation in jet *toward* and *away* from beam as compared to “control” sample  $W \rightarrow \ell \nu$ .

Found relatively more radiation in jet *toward* and *away* from beam as compared to “control” sample  $W \rightarrow \ell \nu$ .

- Started with  $W + 1\text{jet}$  events with strict location cuts
- Counted particles in 7 annular wedges around the  $W$  and the jet
- Took the ratio of each wedge

Annulus:  $0.7 < R < 1.5$

Particles as func. of *rescaled* angle.  
b) same  $W$  c) btw. different  $W$ s

Motivation: Bias in  $m_W$  as compared to  $WW \rightarrow q\bar{q}\ell\nu$ .

Result: No significant colour reconnection *between*  $W$ s.

Same for DELPHI arXiv:0704.0597

# Clean Sample at LHC to Test This?

- B-Tagging gives heavy-quark jets

- B-Tagging gives heavy-quark jets
- Must *know* if it's a light  $q$  or  $g$  jet and *know* the color connection.

- B-Tagging gives heavy-quark jets
- Must *know* if it's a light  $q$  or  $g$  jet and *know* the color connection.
- Turn to  $t\bar{t}$  semileptonic events

- Look for  $W$ 's lepton and missing  $E_T$  and two  $b$  tags that reconstruct  $t\bar{t}$
- The two  $b$  jets are color-connected to the beam (like  $Z + b\bar{b}$  background earlier)
- The two light quark jets from  $W$  are color-connected to each other

- Look for  $W$ 's lepton and missing  $E_T$  and two  $b$  tags that reconstruct  $t\bar{t}$
- The two  $b$  jets are color-connected to the beam (like  $Z + b\bar{b}$  background earlier)
- The two light quark jets from  $W$  are color-connected to each other

**Test QCD and the Monte Carlos:**  
 Given  $b$  tags and *clean* top sample, what do the moments look like?

- Look for  $W$ 's lepton and missing  $E_T$  and two  $b$  tags that reconstruct  $t\bar{t}$
- The two  $b$  jets are color-connected to the beam (like  $Z + b\bar{b}$  background earlier)
- The two light quark jets from  $W$  are color-connected to each other

**Test QCD and the Monte Carlos:**  
Given  $b$  tags and *clean* top sample, what do the moments look like?

**Test the pairing technique:**  
Given the four jet moments, how well can we find the  $W$  color-singlet pair?

# $t\bar{t}$ Event Example 1

## $t\bar{t}$ Event Example 2

# Pairing the 4 $t\bar{t}$ Jets in 3 Ways: 2 Wrong, 1 Right

Mases

dRs

Moment Angles

Likelihood for Angles Only

Likelihood for Angles,  $\Delta\eta_{jj}$ ,  $\Delta\phi_{jj}$ 

meh ... but I didn't look to see if jets point toward the beam jet ...

- Distinguishing *between* events:  $H + Z$  signal vs QCD Background
  - Global energy deposits / track momenta / particle counts in event
  - Moment "pulls" on jets: toward other jets or toward beam

- Distinguishing *between* events:  $H + Z$  signal vs QCD Background
  - Global energy deposits / track momenta / particle counts in event
  - Moment "pulls" on jets: toward other jets or toward beam
- Pairing jets *within* an event:  $t\bar{t} \rightarrow \ell + \nu + 4 \text{ jets}$
